## **Installation:**

<p><b>Detection distance</b></p>  <p>Move the detected object according to assigned method, the distance from the reference position (reference plane) to the detecting action(resetting)</p>	<p><b>Setting distance</b></p>  <p>Including the effects like temperature and voltage, without error action the distance passed through from the practical detection surface to the objected object.</p>	<p><b>Standard detected object</b></p>  <p>Take as standard detected object to detect the basic performance. the shape, size and material have been determined.</p>
<p><b>Differential distance</b></p>  <p>The absolute value of the distance difference between the distance to action and the distance To resetting</p>	<p><b>Response time</b></p>  <p>T1:when the objected object enters the action zone, the time from proximity sensor being in action state to output appearance. T2:the time from leaving action zone to output disappearance.</p>	<p><b>Response frequency</b></p>  <p>Work out the tracking output times per second by repeatedly approaching the detected object Brief detection method sees the above diagram</p>
