DESCRIPTION

The HY628400 is a high-speed, low power and 4M bits CMOS SRAM organized as 524,288 words by 8 bits. The HY628400 uses Hyundai's high performance twin tub CMOS process technology and was designed for high-speed and low power circuit technology. It is particulary well suited for use in high-density and low power system applications. This device has a data retention mode that guarantees data to remain valid at the minimum power supply voltage of 2.0V.

FEATURES

- Fully static operation and Tri-state outputs
- TTL compatible inputs and outputs
- Low power consumption
- Battery backup(L/LL-part)
  - 2.0V(min) data retention
- Standard pin configuration
  - 32pin 525mil SOP
  - 32pin 400mil TSOP-II

  (Standard and Reversed)

Note
1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is stress rating only and the functional operation of the device under these or any other conditions above those indicated in the operation of this specification is not implied. Exposure to the absolute maximum rating conditions for extended period may affect reliablity.

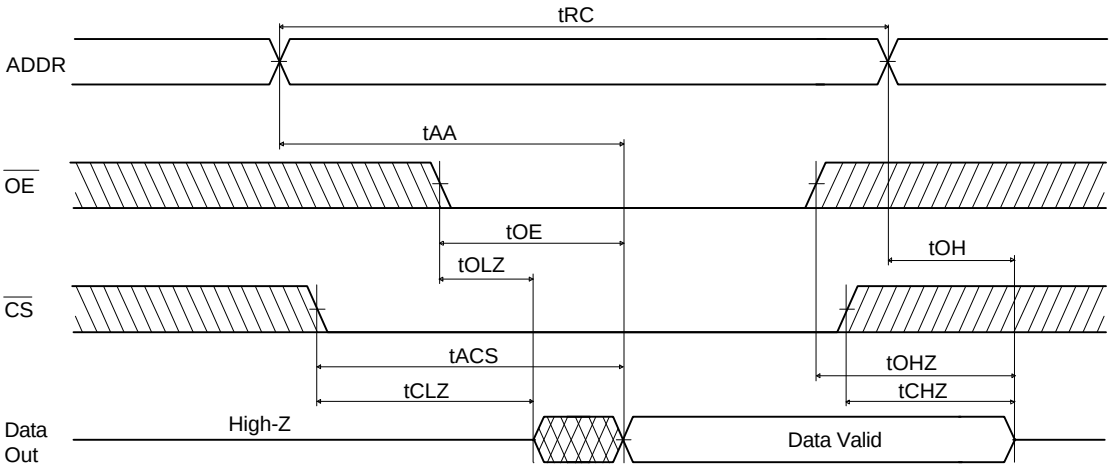
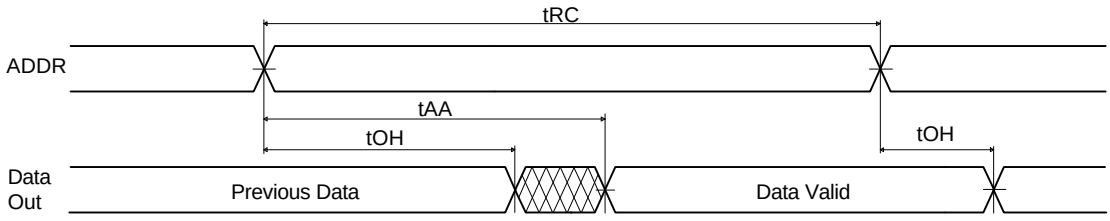
TIMING DIAGRAM

READ CYCLE 1



Note(READ CYCLE):
1. tCHZ and tOHZ are defined as the time at which the outputs achieve the open circuit conditions and are not referenced to output voltage levels
2. At any given temperature and voltage condition, tCHZ max. is less than tCLZ min. both for a given device and from device to device.
3. /WE is high for the read cycle.

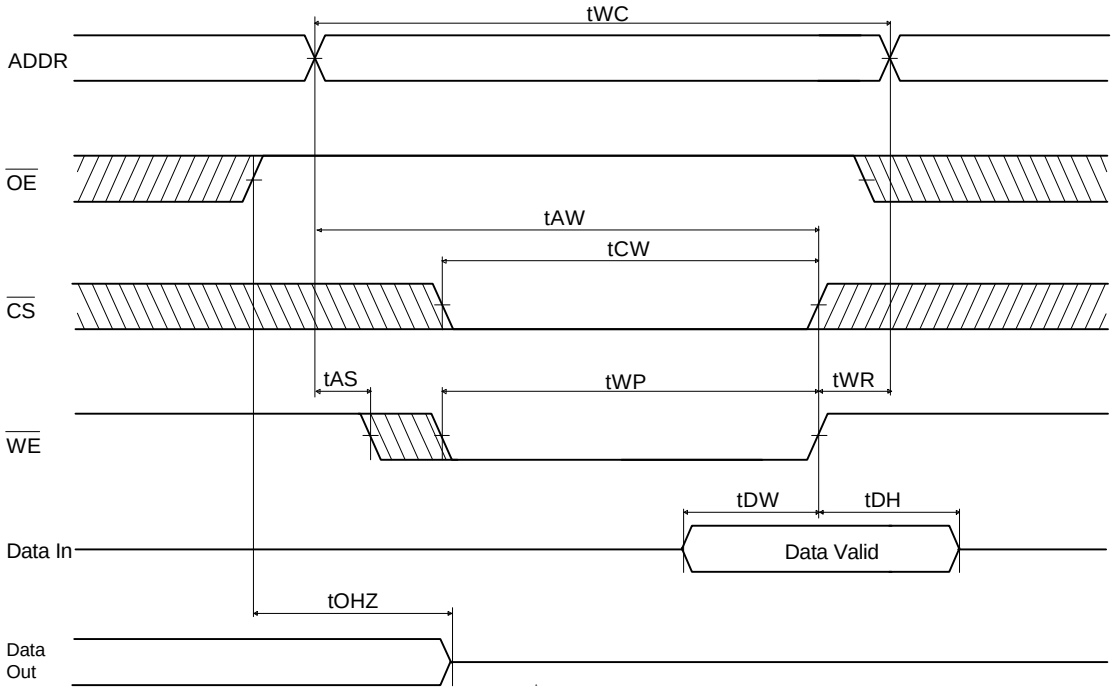
READ CYCLE 2



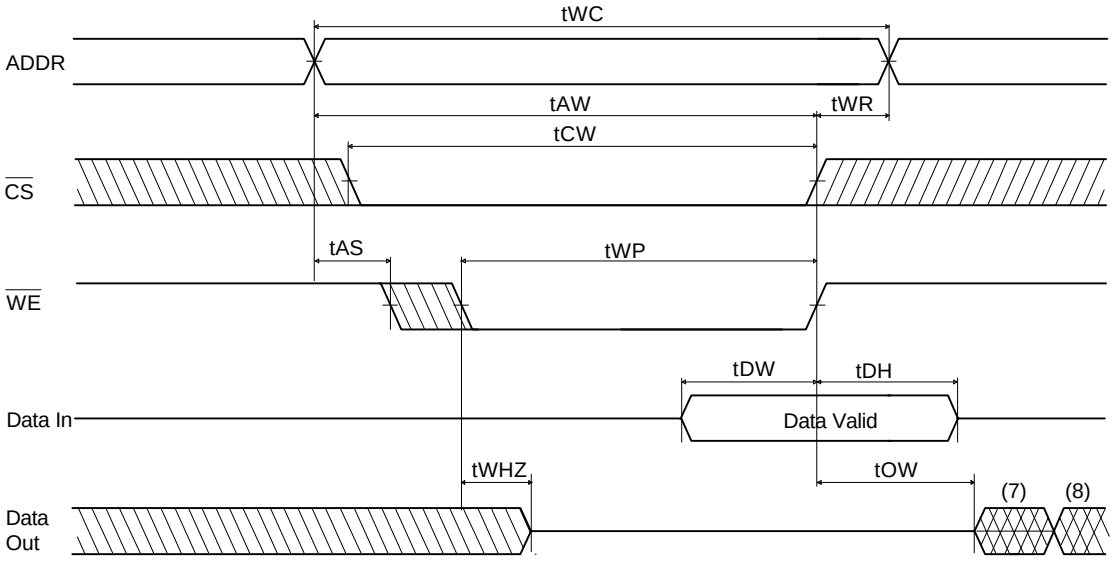
Note(READ CYCLE):

1. /WE is high for the read cycle.
2. Device is continuously selected /CS = V_{IL}
3. /OE =V_{IL}.

WRITE CYCLE 1(/OE Clocked)



WRITE CYCLE 2 (/OE Low Fixed)



Notes(WRITE CYCLE):

1. A write occurs during the overlap of a low /CS and low /WE. A write begins at the latest transition among /CS going low /WE going low: A write end at the earliest transition among /CS going high and /WE going high. tWP is measured from the beginning of write to the end of write. .
2. tCW is measured from the later of /CS going low to the end of write .
3. tAS is measured from the address valid to the beginning of write.
4. tWR is measured from the end of write to the address change.
5. If /OE and /WE are in the read mode during this period, and the I/O pins are in the output low-Z state. Inputs of opposite phase of the output must not be applied because bus contention can occur.
6. If /CS goes low simultaneously with /WE going low, the outputs remain in high impedance state.
7. Dout is the read data of the new address.
8. When /CS is low, I/O pins are in the output state. The input signals in the opposite phase leading to the outputs should not be applied.
